Information Transfer

What is Information Transfer?

Information transfer means converting information from one form to another, for e.g., from a graph to a paragraph, or text to visual. When transferring visual information to text, the process goes beyond stating numbers as it explains what those numbers mean, what patterns exist and what conclusions can be drawn.

Why is Information Transfer Important?

🎯 Simplifies Complex Information

Helps to interpret and present data - critical skills for professional purposes

🧠 Improves Analytical Writing

Sharpens critical and logical analysis

✍️ Builds Communication Skills

Helps express observations clearly

Steps in Information Transfer

1. Observe
Look at the chart/table carefully.
Begin with an overview when writing.

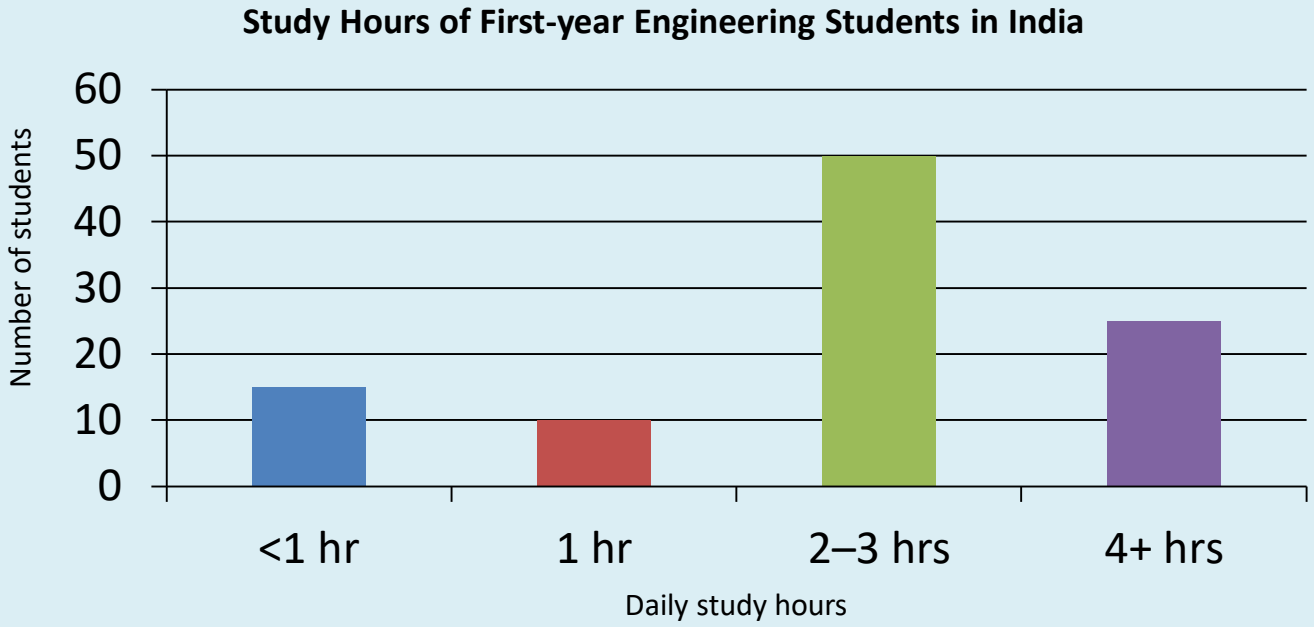

2. Identify Trends
Notice increases, decreases, peaks, lows.

3. Compare
See how categories differ
Use linking words to describe.

4. Write Objectively
Write objectively and coherently.
Personal opinions should be excluded.

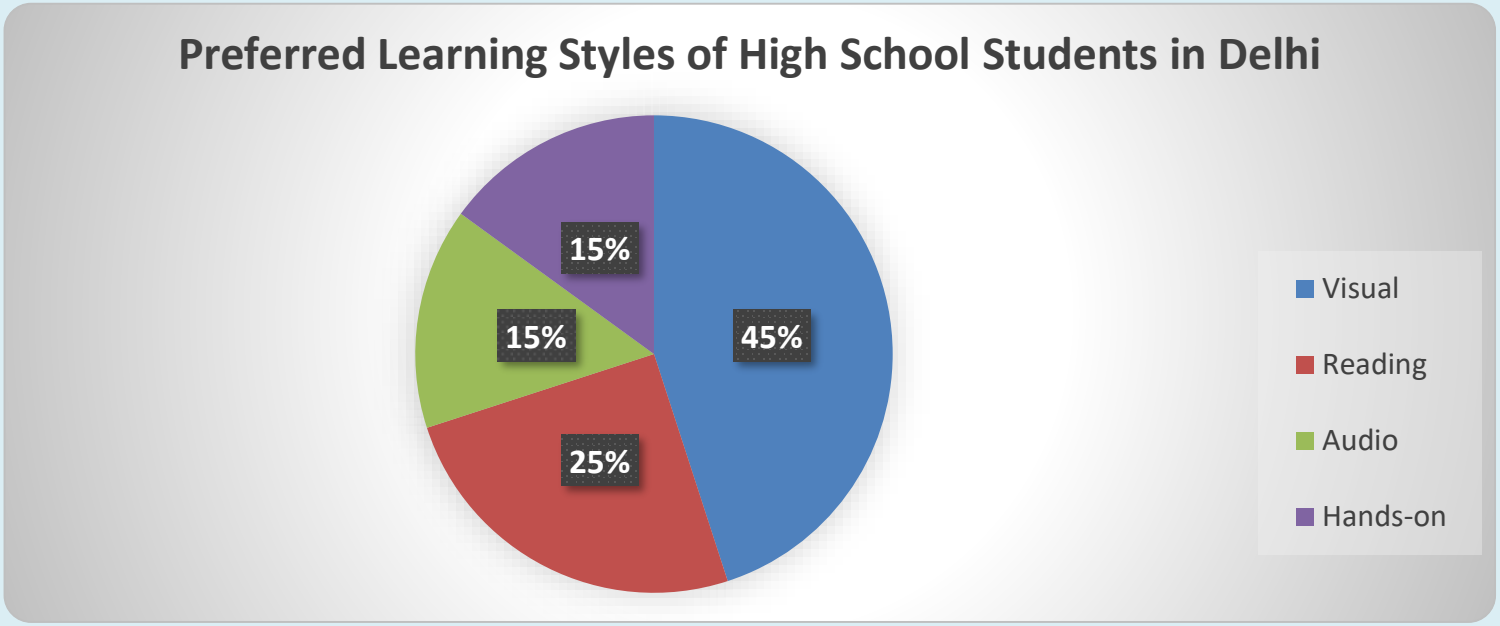

5. Conclude
Summarize and make meaningful deductions.

Example 1

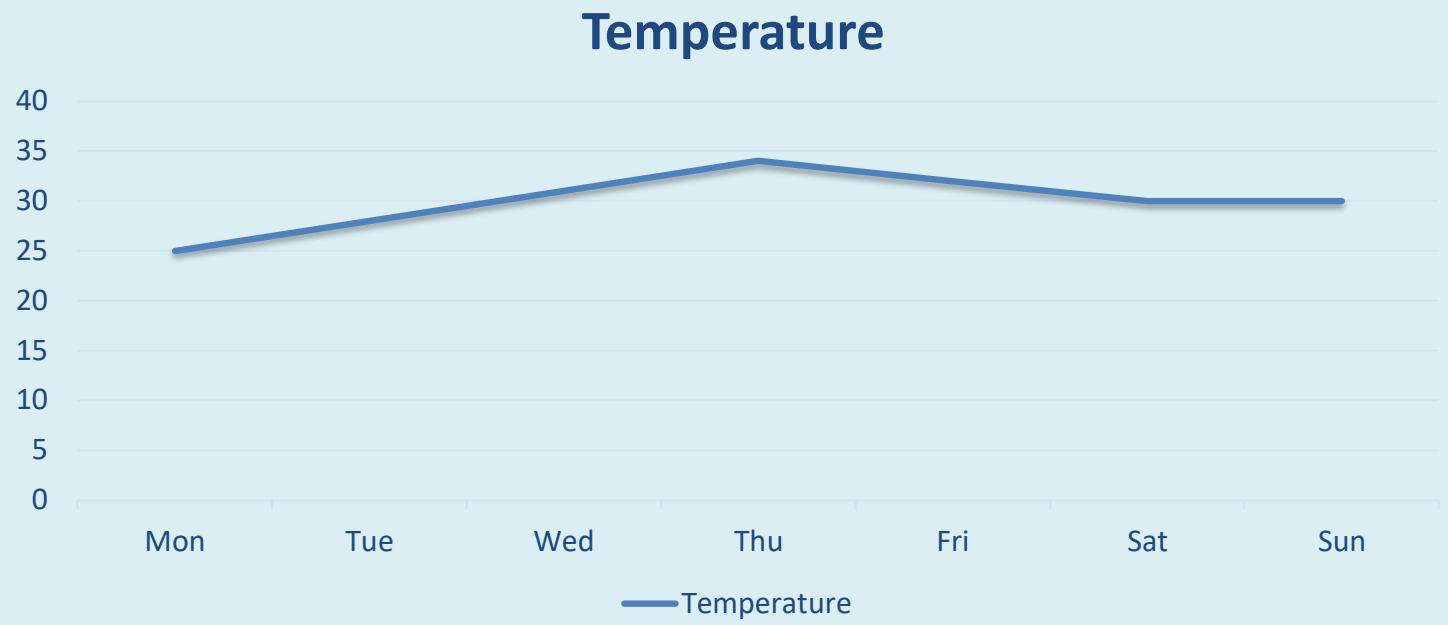

The bar graph presents data on the daily study hours of first-year undergraduate engineering students in India. The majority of students, fifty in number, study for two to three hours each day. Approximately twenty-five students devote more than four hours to study, whereas only a few, around ten to fifteen, spend one hour or less on their daily studies.

Example 2

The pie chart shows that visual learning is the most preferred learning style among high school students in Delhi, chosen by 45% of the students. Reading is the second most popular style at 25%, while audio and hands-on learning, each at 15%, are less common. The chart suggests that teaching methods should primarily include visual elements while also incorporating variety to cater to different learning preferences.

Example 3

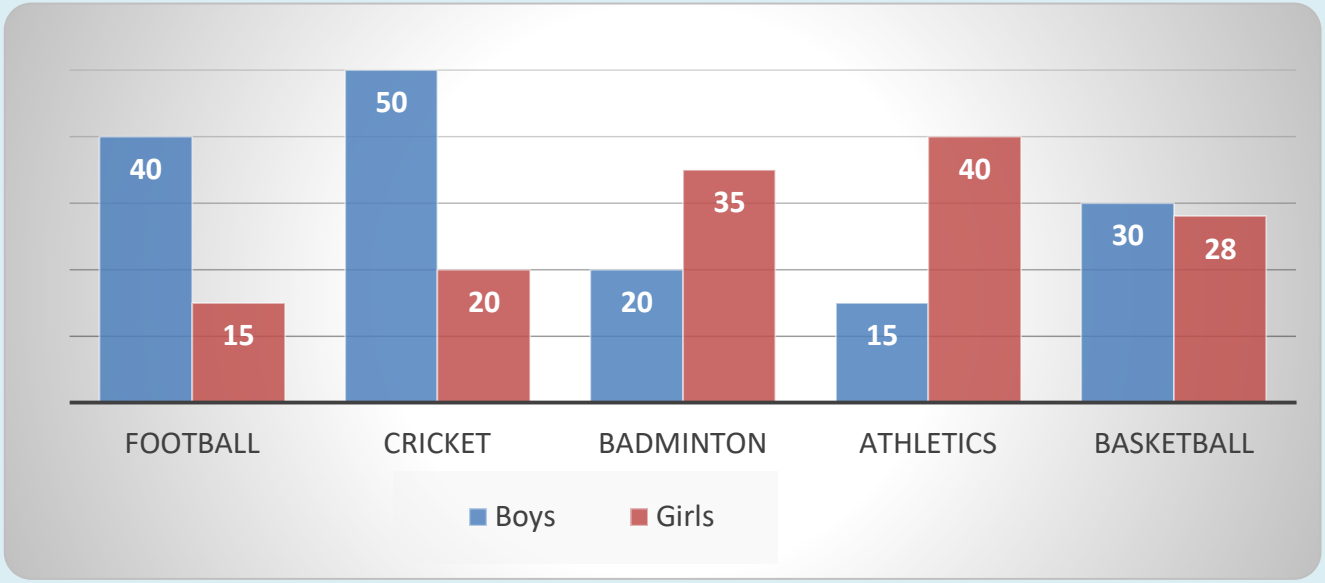

The line graph illustrates temperature changes over a week. Temperatures rise steadily from 25°C on Monday to a peak of 35°C on Thursday. After Thursday, the temperature falls slightly and remains stable at around 30°C from Friday to Sunday.

Example 4:

Subject	Average score of the class
English	78
Maths	85
Science	90
History	65

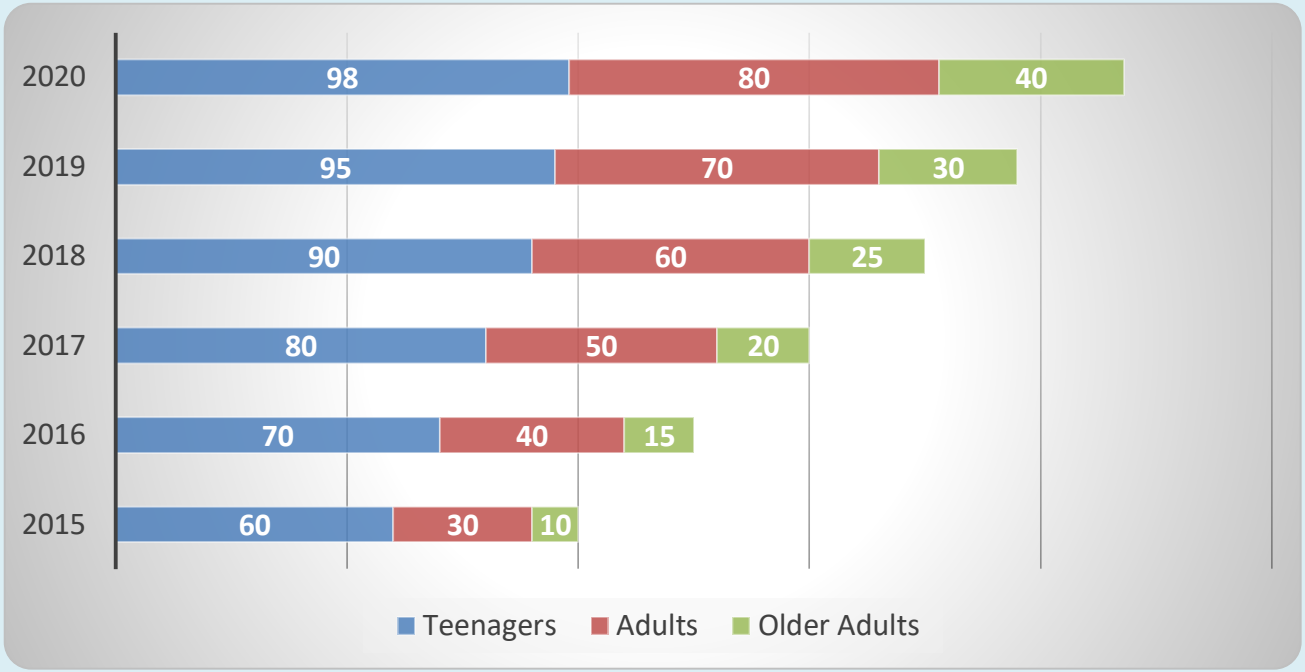

The table indicates that Science has the highest average score in the class at 90, while History records the lowest at 65. Mathematics is comparatively strong with an average of 85, and English is slightly weaker at 78. Overall, the data suggests that students in the class perform well in Maths and Science but require additional support in the humanities.

Example 5

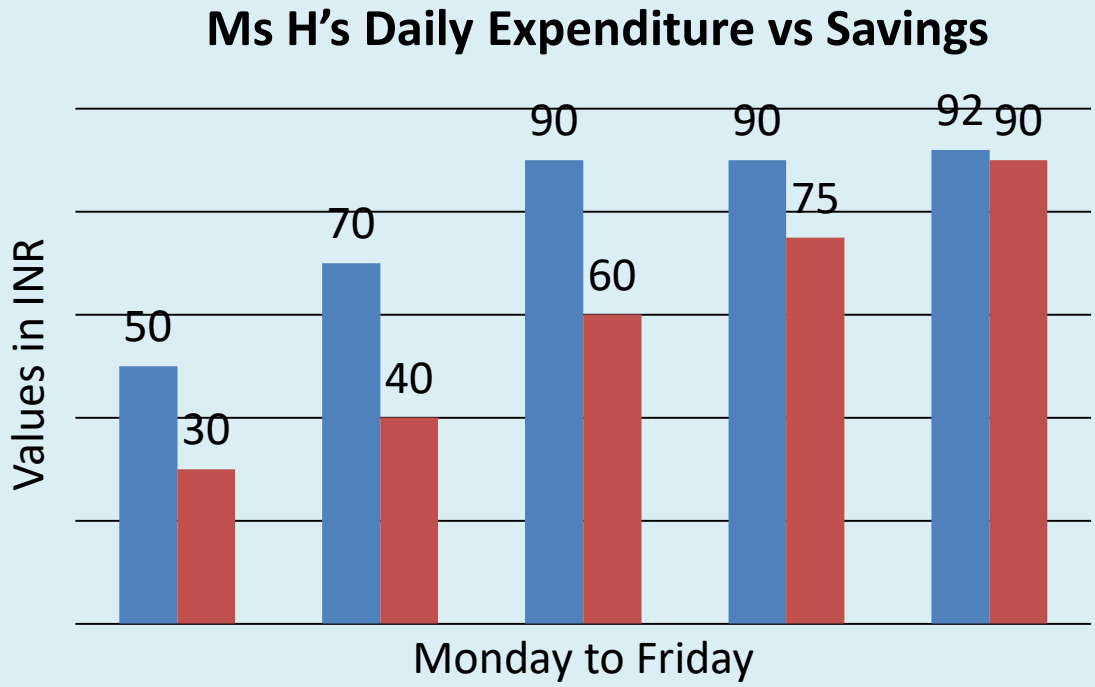

The double bar graph compares the sports participation of boys and girls. Boys participate far more in football and cricket, with 40 and 50 participants respectively, compared to only 15 and 20 among girls. Girls, on the other hand, are more active in badminton and athletics, with 40 and 28 participants respectively, compared to 15 and 30 boys. Interestingly, participation in basketball is relatively balanced, with 20 boys and 35 girls taking part which indicates that this sport appeals to both groups.

Example 6

The graph shows that internet use increased across all age groups between 2015 and 2020. Teenagers recorded the highest usage, rising steadily from 60% in 2015 to 90% in 2018 and reaching 98% by 2020 indicating near-universal access. Adults also showed consistent growth, climbing from 30% in 2015 to 80% in 2020. Senior citizens demonstrated the most significant relative increase, with usage expanding fourfold from 10% in 2015 to 40% in 2020 though they remain the least connected group. Overall, the data highlights the widespread adoption of digital technology across all generations with teenagers continuing to lead.

Practice Question

Study the bar graph showing daily expenditure vs savings of Ms H from Monday to Friday. Write a short paragraph (about 7–8 lines) describing the trends shown in the graph.
