```
1  //Example of Single Inheritance
2  class Parent
3  {
4     void parentClassMember()
5     {
6        System.out.println("This is a parent class member");
7     }
8     static void staticParentMember()
9     {
10       System.out.println("This is a parent class static member");
11    }
12 }
13 class Child extends Parent
14 {
15    void childClassMember()
16    {
17       staticParentMember(); //accessing parent class static member
   function from child class member function
18       parentClassMember(); //accessing parent class member function
   from child class member function
19       System.out.println("This is a child class member");
20    }
21 }
22 public class Main
23 {
24    public static void main(String[] args) {
25       Parent objP=new Parent();
26       Child objC=new Child();
27
28       objP.parentClassMember(); //Object of parent class can only access
    its own members, not the members of its child class
29
30       objC.childClassMember();//Object of child class may access its
   own members as well as the members of its parent class
31       objC.parentClassMember();
32
33       Child.staticParentMember(); //calling parent class static member
   function from the reference of child class
34    }
35 }
```
