```java
/*
static import concept is introduced in 1.5 version.
With the help of static import, we can access the static members
of a class directly without class name or any object.
 */

import static java.lang.System.*;

public class Main {
    public static void main(String[] args) {
        out.println("Example of Static Import");

        // System is a class present in java.lang package
        // and out is a static variable present in System class.
        // By the help of static import we are calling it without class name.
    }
}

/* Note: Ambiguity in static import:
If two static members of the same name are imported from multiple
different classes, the compiler will throw an error, as it will
not be able to determine which member to use in the absence of
class name qualification.
 */
```
