We have check whether balance factor is maintain or not when we are adding or deleting node in a tree if the tree is not balance then firstly balance it then perform insertion or deletion operation.

We have check whether balance factor is maintain or not when we are adding or deleting node in a tree if the tree is not balance then firstly balance it then perform insertion or deletion operation.

Now we have to perform inorder predicessor :- left most element (Largest element from left subtree) or Inorder Succesor:- Right side(smallest element from right subtree).

We have check whether balance factor is maintain or not when we are adding or deleting node in a tree if the tree is not balance then firstly balance it then perform insertion or deletion operation.

Now we have to perform inorder predicessor :- left most element (Largest element from left subtree) or Inorder Succesor:- Right side(smallest element from right subtree).

Now apply inorder predecessor when we have to delete node 14.

Note:- if we have only one child of node that we have to delete then we don't need to perform inorder predecessor or inorder successor.
Eg. when we will delete node 17.
